1.Introduction

The Job Portal and Recruitment Management System is a web application developed using Angular and TypeScript that connects job seekers with recruiters through a responsive and interactive platform. In the modern digital world, organizations require efficient recruitment systems that simplify the hiring process while helping job seekers easily find employment opportunities.

This application acts as an online job marketplace where companies can post job openings and applicants can browse and apply for suitable positions. The system is built as a **Single Page Application (SPA)** using Angular, which allows users to navigate between pages without refreshing the browser. Angular concepts such as **components, services, routing, dependency injection, and forms** are used to design the system. Angular Material is integrated to create a modern and responsive user interface.

2.Objectives

- Develop a Job Portal using Angular and TypeScript.
- Allow job seekers to browse job listings.
- Allow recruiters to post job openings.
- Implement Angular routing for navigation.
- Use Angular Material for responsive UI design.
- Demonstrate modular Angular architecture

3. System Overview

The Job Portal and Recruitment Management System provides a centralized platform where job seekers and recruiters interact.

The system allows users to:

- Browse available jobs.
- Filter jobs by category or location.
- View job details.
- Apply for jobs

Recruiters can:

- Post job openings.
- Manage job listings.
- Review applicants

Angular components organize the application into reusable modules, making the system scalable and maintainable.

4. Features of the System

Home Page

The home page introduces the platform and allows users to quickly browse jobs or post job openings.

Figure 1: Home page of the Job Portal

Job Listings

The job listing page displays available jobs in card format with details such as:

- Job title.
- Company name.
- Location.
- Salary range.
- Required technologies

Users can also filter jobs by category, location, and experience level.

Figure 2: Job listings page

Job Details

The job detail page displays full information about a specific job including job description, salary range, and required skills.

Application System

Applicants can apply directly through the system using Angular forms with proper validation.

5. Angular Components Used

The system is divided into multiple Angular components:
job-list component.

- Displays all available job openings.
- **job-detail component.**
- Shows detailed information about a selected job.
- **apply-job component.**
- Allows users to submit job applications.
- **company-dashboard component.**
- Allows recruiters to manage job postings.
- **navbar component.**
- Provides navigation across different sections.

6. Technologies Used

Framework:

Angular Language:

TypeScript UI Library:

Angular Material Development Tools: Node.js, Angular CLI, Visual Studio

Code Backend Simulation: JSON Server / Static JSON files

7. Advantages

- Provides a centralized recruitment platform.
- Simplifies job searching and hiring process.
- Responsive and modern UI design.
- Demonstrates real-world Angular architecture.
- Modular and scalable application structure

8. Limitations

- Uses a mock backend instead of a real database.
- Limited job listings.
- No authentication system implemented.
- No AI job recommendation system.

9.Future Enhancements

- Integration with real backend database.
- Resume upload feature.
- AI-based job recommendations.
- Email notifications for job applications.
- Mobile application version

10.Conclusion

The Job Portal and Recruitment Management System demonstrates how Angular and TypeScript can be used to build a modern web application. The system allows job seekers to explore job opportunities and apply for positions while enabling recruiters to manage job postings efficiently.

The project successfully showcases Angular concepts such as components, routing, services, dependency injection, and reactive forms while providing a responsive and user-friendly interface.
